This printer's Z axis driver isn't working. It's unclear why it failed. Motors are tested independently and working fine.

The enclosure is excellent, but the printer's motherboard is a bit dated. If you need to print high-temp filaments on a hot bed, this printer is a great budget machine to use.

If I were to fix it, I'd either get all new, silent, smooth stepping drivers (easiest) or a new motherboard. Drivers range in prices from \$8 for a single replacement for what's in there now to more like \$45 for a full set of silent drivers (<https://www.amazon.ca/BIGTREETECH-TMC2208-Stepper-Heatsink-Motherboard/dp/B07WGCF3L2?th=1>).

... actually quite good, even with basic drivers.
